The transmitter was placed on a wooden turntable, and it was transmitting into a non-radiating load which was also placed on the turntable.

Report No.: RSH180305059-00

The measurement antenna was placed at a distance of 3 meters from the EUT. During the tests, the receiving antenna height and polarization as well as EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. The test was performed by placing the EUT on 3-orthogonal axis.

The frequency range up to tenth harmonic of the fundamental frequency was investigated.

## FCC § 2.1055; §27.54 - FREQUENCY STABILITY

## **Applicable Standard**

FCC § 2.1055 and & §27.54.

According to FCC §2.1055, the frequency stability shall be sufficient to ensure that the fundamental emissions stay within the authorized bands of operation.

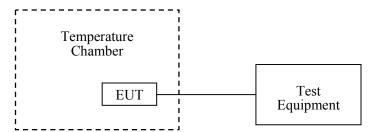

Report No.: RSH180305059-00

#### **Test Procedure**

Frequency Stability vs. Temperature: The equipment under test was connected to an external DC power supply and the RF output was connected to communication test set via feed-through attenuators. The EUT was placed inside the temperature chamber. The DC leads and RF output cable exited the chamber through an opening made for the purpose.

After the temperature stabilized for approximately 20 minutes, the frequency output was recorded from the communication test set.

Frequency Stability vs. Voltage: For hand carried, battery powered equipment; reduce primary supply voltage to the battery operating end point which shall be specified by the manufacturer.

#### **Test Data**

#### **Environmental Conditions**

Temperature:	25 ℃		
Relative Humidity:	52 %		
ATM Pressure:	101.0 kPa		

The testing was performed by Jacob Kong on 2018-05-10.

EUT operation mode: Transmitting

Test Result: Compliance. Please refer to the following tables.
